

June Kim

Vancouver, Canada | june@june.kim | june.kim | github.com/kimjune01

Summary

Senior applied AI and software engineer with 10+ years shipping production systems at Google, Loom, and startups. Builds LLM-powered products end to end: ingestion, retrieval, agent workflows, integrations, evaluation, and reliability. Strongest in ambiguous product environments where sound engineering judgment matters more than a fixed playbook.

Work Experience

Independent | Senior Applied AI & Reliability Engineer 2025 – present

- Shipped production AI and data systems for startup clients, then expanded the same reliability practice into independent evaluation of coding agents and their test infrastructure.
- Built OAuth integrations for Circle, Notion, Front, and Attio; shipped deduplication, LLM field classification with confidence scoring, CI quality gates, E2E infrastructure, and an accessibility-data ingestion pipeline.
- Built an agent workflow for issue discovery, patching, testing, and review that produced 111 merged pull requests across 89 external repositories in Rust, Go, C++, and Python.

Little Bird Software | Applied AI Engineer 2024 – 2025

- Built agentic ingestion pipelines using LLM condensation and deduplication to cut noise 90%; developed Python orchestration services and zero-downtime migrations.
- Architected macOS and Chrome integrations in Swift, Tauri, and Rust over Accessibility APIs for real-time context injection.
- Built the end-to-end RAG path from unstructured desktop data through filtering, extraction, parsing, condensation, and vector retrieval.

Loom | Senior Software Engineer 2022 – 2023

- Raised core video reliability from 97% to 99.7% through multiresolution UI and Shaka Player integration; led a TypeScript refactor of the Electron desktop app.

YouTube / Google | Software Engineer 2019 – 2022

- Turned product requirements into design documents and production implementations while re-architecting the YouTube iOS rendering layer in C++ and TypeScript, reducing UI deployment cycles from months to days.
- Directed the launch of a Premium sign-up framework that increased conversion 2% across 50M+ users; conducted dozens of L3/L4 technical interviews.

Earlier Product Engineering | Firework, Lipsi & Startups 2013 – 2019

- Shipped mobile and web products in Swift, Objective-C, React Native, Rails, and AWS; helped grow Lipsi from launch to 2.3M users and #1 in the US Lifestyle category.
- Trained multiple Lighthouse Labs iOS cohorts from first principles to junior-developer readiness; graduates joined teams including Nike and Hootsuite.

AI Systems, Reliability & Open Source

- Built determinacy, a tool for tracing coding-benchmark scores to agent-visible evidence; audited 728 SWE-bench Pro tasks and contributed reliability checks to Harbor and Inspect AI. Work and receipts: june.kim/research
- Stress-tested LLM measurement pipelines with controls and replayable artifacts; withdrew a promising result when a new control showed the effect was below the run-to-run noise floor.

Education

Bachelor of Science in Computing (second degree) | Simon Fraser University 2015 – 2017

- Coursework included machine learning, systems, algorithms, databases, security, computer vision, programming languages, and numerical analysis.

Bachelor of Business Administration | Simon Fraser University 2008 – 2012

- Product, operations, strategy, finance, accounting, management science, and entrepreneurship.

Skills

- Engineering: Python, TypeScript, Rust, C/C++, Go, Swift; FastAPI, CI/CD, Git/GitHub; production debugging, migrations, APIs, OAuth, browser and desktop integrations
- Applied AI: agent and tool orchestration, RAG, embeddings, MCP, structured extraction, evals, graders, regression testing, failure analysis, reproducible artifacts
