Summary

AI systems / research engineer building cognition, epistemology, and agentic workflows as foundations for better AI-assisted software. 10+ years of software engineering experience at Google, Loom, and startups. Builds working systems, runs artifact-level experiments, and turns research ideas into public tools, protocols, and evidence.

Selected Research & Systems Work

SWE-bench Verified 97%: Agent Evaluation Pipeline

May 2026

- Built a reproducible recon/craft/audit agent pipeline for SWE-bench Verified, with separate diagnostic, implementation, and verification stages run against offline Docker environments.
- Produced official-grader-verified artifacts with committed patches, summaries, failures, exclusions, and an append-only audit trail; reported 426 / 438 eligible resolved with explicit contamination and denominator caveats.
- Designed the system around inspectable merit: every win and loss is traceable through public artifacts, frozen skills, official evaluation reports, and re-runnable procedure.

Agentic Open-Source Contribution Pipeline

May 2026

- Built and operated an agentic pipeline for finding open-source issues, generating patches, submitting PRs, and tracking maintainer outcomes across public repositories.
- Measured merge/rejection outcomes, maintainer feedback, review latency, and failure modes across real PR workflows.
- Produced case studies including Speedrunning Open Source, Sweep & Triage, (Issue) → PR, and (PR) → merged.

Public Research: Cognition, Epistemology, and Agentic Systems

March - 2026

- Developed a theory-to-artifact research program on abduction, memory, provenance, review loops, and LLM quality degradation.
- Created technical research notes including The Natural Framework, The Hypothesis Graph, Modes of Reason, Abduction, The Parts Bin, and Memory Compression.
- Used the framework to guide experiments and systems: Slop Slope, agentic open-source contribution pipelines, PageLeft, and runnable textbooks.

Work Experience

Independent Contractor

Applied AI Engineer

2025 – 2026

- Anyteam.com: Designed and shipped an accessibility data pipeline for the Sales OS and a browser-extension-based web scraper to ingest and retrieve domain knowledge via Retrieval-Augmented Generation.
- Buildbetter.ai: Built 4 third-party integrations (Circle.so, Notion, Front, Attio) with incremental sync, OAuth2 flows, and deduplication, expanding the platform's customer data ingestion surface.
- Developed AI-powered field classification system using LLMs to automatically map import columns with confidence scoring, and prototyped custom AI agents for customer signal analysis.
- Shipped CI/CD quality gates, E2E testing infrastructure, and reusable developer tooling (Claude Code skills for log querying, migration gen, CI failure analysis).

Little Bird Software

AI Engineer

2024 – 2025

- Designed and implemented agentic data ingestion pipelines, utilizing LLM-based condensation (Claude, GPT-4, Gemini Flash) and deduplication to reduce noise by 90%, directly improving RAG retrieval accuracy and chat grounding.
- Architected macOS and Chrome integrations (Swift, Tauri, Rust) using Accessibility APIs to enable real-time context injection for AI agents.
- Developed core Python backend services for prompt orchestration and object deduplication, leading infrastructure migrations with zero user downtime.
- Built end-to-end RAG ingestion pipeline: filtered, extracted, parsed, and condensed unstructured desktop accessibility data into a searchable vector store.

Loom

Senior Software Engineer

2022 – 2023

- Optimized core video infrastructure, increasing system reliability from 97% to 99.7% via multi-resolution UI implementations and Shaka Player interfacing.
- Architected a TypeScript refactor of the Electron desktop app, reducing maintenance overhead and improving cross-platform performance.

Youtube / Google

Software Engineer

2019 – 2022

- Independently contributed to front-end features promoting YouTube Premium subscriptions, using C++ and Objective-C.
- Directed the launch of a high-visibility Premium sign-up framework, resulting in a 2% lift in conversion rates impacting 50M+ users.
- Conducted dozens of technical interviews for L3/L4 engineering candidates, helping scale the Music & Premium organization.

Earlier Experience

- **Loop Now Technologies (Firework)** – React Native & iOS Engineer (2018–2019). Built cross-platform UI features; patented video view technology.
- **Lipsi Technologies – Senior iOS Developer** (2016–2018). Scaled anonymous messaging app to #1 Lifestyle on App Store USA and 2.3M users.
- **Nano 3 Labs / Lighthouse Labs / Camvy** (2013–2015). iOS development, AR prototyping, teaching, full-stack Rails.

Education

Bachelor of Science (2nd degree)

Simon Fraser University, Canada

2015–2017

- Data structures and algorithms, databases, machine learning, numerical analysis, computer architecture, networking, satisfiability, operating systems, computer vision, technical writing, security, web development, programming languages

Bachelor of Business Administration

Simon Fraser University, Canada

2008–2012

- Project management, management science, organizational theory, organizational behaviour, marketing, finance, accounting, business writing, business strategy, operational simulation, operations management, entrepreneurship
